Features

The NISMO Low-Temp Thermostat's radiator valve opens at a lower temperature, 62°C as opposed to the standard 76.5°C. Getting the coolant circulating inside the engine earlier reduces the power loss commonly caused by rising temperatures like, for example, when high speed driving at a racetrack. Setting the valve's release threshold to a lower temperature keeps your fuel mix rich.

Product Warning

In low winter temperatures, the temperature of the water within the engine will not rise as quickly. This can reduce heater performance.
